

# Naming Compounds Handout

## IONIC COMPOUNDS versus MOLECULAR COMPOUNDS

- ionic compound:** consist of **cations** (positive ions) and **anions** (negative ions) held together by electrostatic attraction
- usually **metal + nonmetal(s)**
  - made of monatomic ions, polyatomic ions, and/or both
  - **monatomic ions:** consist of a single atom
  - **polyatomic ions:** consist of more than one atom

- molecular compound:** consist of **nonmetal atoms** bonded together by shared electrons (covalent bonding)
- **acid:** a molecular compound that releases hydrogen ions ( $H^+$ ) when dissolved in water

## NAMING MONATOMIC CATIONS:

Metal atoms lose valence electrons to form positively charged ions, called **cations**.

An ion formed from an individual atom is a **monatomic** (or monoatomic) **cation**.

- Groups IA to IIIA elements silver (Ag), zinc (Zn) and cadmium (Cd) form only one type of ion each:
  - Group IA elements form +1 ions:  $Li^+$ ,  $Na^+$ ,  $K^+$ ,  $Rb^+$ ,  $Cs^+$
  - Group IIA elements form +2 ions:  $Be^{+2}$ ,  $Mg^{+2}$ ,  $Ca^{+2}$ ,  $Sr^{+2}$ ,  $Ba^{+2}$
  - Group IIIA elements form +3 ions:  $Al^{+3}$
  - silver ion =  $Ag^+$ ; zinc ion =  $Zn^{+2}$ ; cadmium ion =  $Cd^{+2}$

When a Group IA–IIIA element, silver, zinc, or cadmium forms an ion, it is named:

- element name + ion**
- e.g.  $Na^+$  = sodium ion       $Sr^{+2}$  = strontium ion       $Zn^{+2}$  = zinc ion

II. The **Stock system** is used to name transition metals and other metals that form more than one ion:

- iron (Fe) forms two ions:  $Fe^{+2}$  and  $Fe^{+3}$
- lead (Pb) forms two ions:  $Pb^{+2}$  and  $Pb^{+4}$

When a metal can form more than one ion, each ion is named:

### element name (charge in Roman numerals) + ion

- e.g.  $Fe^{+2}$  = iron (II) ion       $Pb^{+2}$  = lead (II) ion       $Cu^+$  = copper (I) ion  
 $Fe^{+3}$  = iron (III) ion       $Pb^{+4}$  = lead (IV) ion       $Cu^{+2}$  = copper (II) ion

Name each of the following monatomic cations:

$Li^+$  = \_\_\_\_\_       $Cd^{+2}$  = \_\_\_\_\_

$Ag^+$  = \_\_\_\_\_       $Cu^{+2}$  = \_\_\_\_\_

$Al^{+3}$  = \_\_\_\_\_       $Mg^{+2}$  = \_\_\_\_\_

$Mn^{+2}$  = \_\_\_\_\_       $Sn^{+4}$  = \_\_\_\_\_

$H^+$  = \_\_\_\_\_       $Co^{+3}$  = \_\_\_\_\_

$Fe^{+3}$  = \_\_\_\_\_       $Na^+$  = \_\_\_\_\_

$K^+$  = \_\_\_\_\_       $Tl^{+4}$  = \_\_\_\_\_

$Ca^{+2}$  = \_\_\_\_\_       $Ni^{+2}$  = \_\_\_\_\_

### NAMING MONATOMIC ANIONS:

Nonmetal atoms gain valence electrons to form **negatively charged ions** called anions.

When a nonmetal forms an ion, it is named:

**element stem name + "ide" + ion**

e.g. O = oxygen atom  $\Rightarrow$  O<sup>-2</sup> = oxide ion  
N = nitrogen atom  $\Rightarrow$  N<sup>-3</sup> = nitride ion

Name each of the following monatomic anions:

F<sup>-</sup> = \_\_\_\_\_ Cl<sup>-</sup> = \_\_\_\_\_  
Br<sup>-</sup> = \_\_\_\_\_ S<sup>-2</sup> = \_\_\_\_\_  
I<sup>-</sup> = \_\_\_\_\_ P<sup>-3</sup> = \_\_\_\_\_

### NAMING POLYATOMIC IONS:

Ions made up of more than one atom are **polyatomic ions**:

- only one polyatomic cation: NH<sub>4</sub><sup>+</sup> = **ammonium ion**
- many polyatomic anions: see table below

#### Polyatomic ions

NH <sub>4</sub> <sup>+</sup> = ammonium ion	NO <sub>2</sub> <sup>-</sup> = nitrite ion	C <sub>2</sub> H <sub>3</sub> O <sub>2</sub> <sup>-</sup> = acetate ion
OH <sup>-</sup> = hydroxide ion	NO <sub>3</sub> <sup>-</sup> = nitrate ion	PO <sub>4</sub> <sup>-3</sup> = phosphate ion
CN <sup>-</sup> = cyanide ion	SO <sub>4</sub> <sup>-2</sup> = sulfate ion	MnO <sub>4</sub> <sup>-</sup> = permanganate ion
CrO <sub>4</sub> <sup>-2</sup> = chromate ion	SO <sub>3</sub> <sup>-2</sup> = sulfite ion	CO <sub>3</sub> <sup>-2</sup> = carbonate ion
Cr <sub>2</sub> O <sub>7</sub> <sup>-2</sup> = dichromate ion		
HCO <sub>3</sub> <sup>-</sup> = hydrogen carbonate ion or bicarbonate ion		

Name each of the following polyatomic ions:

CN<sup>-</sup> = \_\_\_\_\_ CrO<sub>4</sub><sup>-2</sup> = \_\_\_\_\_  
SO<sub>4</sub><sup>-2</sup> = \_\_\_\_\_ NO<sub>3</sub><sup>-</sup> = \_\_\_\_\_  
OH<sup>-</sup> = \_\_\_\_\_ PO<sub>4</sub><sup>-3</sup> = \_\_\_\_\_  
NH<sub>4</sub><sup>+</sup> = \_\_\_\_\_ C<sub>2</sub>H<sub>3</sub>O<sub>2</sub><sup>-</sup> = \_\_\_\_\_

### WRITING CHEMICAL FORMULAS GIVEN INDIVIDUAL IONS

Compounds must be neutral  $\Rightarrow$  total +ve charge = total -ve charge

1. If the two ions have exactly opposite charges (+1 and -1, +2 and -2, +3 and -3) the formula of the compound contains one of each ion

e.g. Na<sup>+</sup> + Cl<sup>-</sup>  $\Rightarrow$  NaCl    K<sup>+</sup> + NO<sub>3</sub><sup>-</sup>  $\Rightarrow$  KNO<sub>3</sub>  
Ca<sup>+2</sup> + S<sup>-2</sup>  $\Rightarrow$  CaS    Ba<sup>+2</sup> + SO<sub>4</sub><sup>-2</sup>  $\Rightarrow$  BaSO<sub>4</sub>  
Al<sup>+3</sup> + N<sup>-3</sup>  $\Rightarrow$  AlN    Fe<sup>+3</sup> + PO<sub>4</sub><sup>-3</sup>  $\Rightarrow$  FePO<sub>4</sub>

Combine each pair of ions to get the formula of the compound they form:

NH<sub>4</sub><sup>+</sup> + F<sup>-</sup>  $\Rightarrow$  \_\_\_\_\_ Li<sup>+</sup> + CN<sup>-</sup>  $\Rightarrow$  \_\_\_\_\_  
Sr<sup>+2</sup> + CO<sub>3</sub><sup>-2</sup>  $\Rightarrow$  \_\_\_\_\_ Al<sup>+3</sup> + PO<sub>4</sub><sup>-3</sup>  $\Rightarrow$  \_\_\_\_\_  
Na<sup>+</sup> + C<sub>2</sub>H<sub>3</sub>O<sub>2</sub><sup>-</sup>  $\Rightarrow$  \_\_\_\_\_ K<sup>+</sup> + OH<sup>-</sup>  $\Rightarrow$  \_\_\_\_\_  
Ni<sup>+2</sup> + CrO<sub>4</sub><sup>-2</sup>  $\Rightarrow$  \_\_\_\_\_ Fe<sup>+3</sup> + N<sup>-3</sup>  $\Rightarrow$  \_\_\_\_\_  
Cd<sup>+2</sup> + SO<sub>4</sub><sup>-2</sup>  $\Rightarrow$  \_\_\_\_\_ Co<sup>+3</sup> + P<sup>-3</sup>  $\Rightarrow$  \_\_\_\_\_

## CHEMICAL FORMULAS AND NAMES FROM INDIVIDUAL IONS

Compounds are named from the individual ions they come from.

**Name the cation and the anion, then remove "ion" from each name:**

e.g.  $\text{Na}^+$  = sodium ion  $\Rightarrow$   $\text{NaCl}$  = sodium chloride  
 $\text{Cl}^-$  = chloride ion  $\Rightarrow$   $\text{K}_2\text{CO}_3$  = potassium carbonate  
 $\text{K}^+$  = potassium ion  $\Rightarrow$   $\text{Fe}^{+3}$  = iron (III) ion  
 $\text{CO}_3^{-2}$  = carbonate ion  $\Rightarrow$   $\text{Fe}(\text{NO}_3)_3$  = iron (III) nitrate  
 $\text{Fe}^{+3}$  = iron (III) ion  $\Rightarrow$   $\text{Ag}_2\text{S}$  = silver sulfide  
 $\text{NO}_3^-$  = nitrate ion  $\Rightarrow$   $\text{Ag}^+$  = silver ion  
 $\text{S}^{-2}$  = sulfide ion  $\Rightarrow$

Combine each pair of ions to get the chemical formula, then name the compound:

Individual Ions	Compound Formula	Compound Name
$\text{Mg}^{+2}$ $\text{F}^-$	$\text{MgF}_2$	magnesium fluoride
$\text{Ni}^{+2}$ $\text{S}^{-2}$		
$\text{Ca}^{+2}$ $\text{Br}^-$		
$\text{Al}^{+3}$ $\text{P}^{-3}$		
$\text{Co}^{+2}$ $\text{NO}_2^-$		
$\text{K}^+$ $\text{CrO}_4^{-2}$		
$\text{Fe}^{+3}$ $\text{O}^{-2}$		

2a. If two monatomic ions have different charges  
 $\Rightarrow$  use **crossover rule to get formula of the compound**  
 - superscript for cation becomes subscript for anion  
 - superscript for anion becomes subscript for cation  
 - **simplify subscripts to get lowest ratio of atoms**  
 (Note: Only the numbers cross down, not the signs!)

$\text{Na}^+$   $\text{S}^{2-}$   $\text{Ba}^{2+}$   $\text{N}^{3-}$   $\text{Ti}^{4+}$   $\text{O}^{2-}$   
 $\text{Na}_2\text{S}$   $\text{Ba}_3\text{N}_2$   $\text{TiO}_2$

$\text{Ti}_2\text{O}_4$  is simplified!

b. If two ions have different charges and at least polyatomic ion is involved  
 $\Rightarrow$  use **crossover rule to get formula of the compound**  
 - if more than one of polyatomic ion in formula, use parentheses  
 - **simplify subscripts to get lowest ratio of atoms**  
 (Note: Again only the numbers cross down, not the signs!)

$\text{NH}_4^+$   $\text{O}^{2-}$   $\text{Ca}^{2+}$   $\text{NO}_3^-$   $\text{Pb}^{4+}$   $\text{SO}_4^{2-}$   
 $(\text{NH}_4)_2\text{O}$   $\text{Ca}(\text{NO}_3)_2$   $\text{Pb}(\text{CO}_3)_2$

$\text{Pb}_2(\text{CO}_3)_4$  is simplified!

Combine each pair of ions to get the formula of the compound they form:

### GIVEN THE CHEMICAL FORMULA, NAME THE COMPOUND

1. If the metal is in Groups IA–IIA, silver, cadmium, or zinc, then just name the metal cation and the anion:

e.g.  $\text{NaCl} \Rightarrow \text{Na} = \text{sodium}$  and  $\text{Cl} = \text{chloride} \Rightarrow \text{sodium chloride}$

$\text{BaI}_2 \Rightarrow \text{Ba} = \text{barium}$  and  $\text{I} = \text{iodide} \Rightarrow \text{barium iodide}$

$\text{Al(OH)}_3 \Rightarrow \text{Al} = \text{aluminum}$  and  $\text{OH} = \text{hydroxide} \Rightarrow \text{aluminum hydroxide}$

$\text{ZnSO}_4 \Rightarrow \text{Zn} = \text{zinc}$  and  $\text{SO}_4 = \text{sulfate} \Rightarrow \text{zinc sulfate}$

2. If the metal can form more than one ion,

a. Use reverse crossover to get the individual ions

– Make the **subscript of cation** the **negative charge of anion**

– Make the **subscript of anion** the **positive charge of cation**

b. Check to make sure the charges on the ions are correct

c. Name the cation and the anion, then remove "ion" from both

e.g.  $\text{NiBr}_2 \Rightarrow \text{Ni}^{+2} = \text{nickel (II)}$  ion  $\text{Br}^- = \text{bromide}$  ion  
Is bromide's charge really  $-1$ ? YES!

then  $\Rightarrow \text{NiBr}_2 = \text{nickel (II) bromide}$

d. If a polyatomic ion is involved, remember that more than one polyatomic is shown in parentheses—i.e. **DO NOT bring up the subscript of atoms in a polyatomic ion to be the charge of the metal!**

**CuSO<sub>4</sub>**  $\Rightarrow$  There is only ONE Cu and ONE SO<sub>4</sub>, so get the charge for the Cu based on the SO<sub>4</sub>. The formula is **SO<sub>4</sub><sup>-2</sup>**, and there is only ONE **SO<sub>4</sub><sup>-2</sup>**, so Cu's charge here must be **+2** for the compound to have an overall charge of zero.  
 $\Rightarrow \text{Cu}^{+2} = \text{copper (II)}$  ion **SO<sub>4</sub><sup>-2</sup> = sulfate** ion  
then  $\Rightarrow \text{CuSO}_4 = \text{copper (II) sulfate}$

Give the name for each compound given its chemical formula:

Formula	Individual Ions	Name of Compound
MgCl <sub>2</sub>	Mg <sup>+2</sup> Cl <sup>-</sup>	magnesium chloride
LiOH		
ZnCO <sub>3</sub>		
K <sub>2</sub> S		
FePO <sub>4</sub>		
SnO <sub>2</sub>		
CuBr <sub>2</sub>		
Ag <sub>3</sub> N		
Mn(CN) <sub>2</sub>		
AgC <sub>2</sub> H <sub>3</sub> O <sub>2</sub>		

### WRITING CHEMICAL FORMULAS GIVEN THE COMPOUND NAME

Get the individual ions from the name, then combine them using the crossover rule:

e.g. barium chloride  $\Rightarrow$  barium = Ba<sup>+2</sup> chloride = Cl<sup>-</sup>

aluminum sulfate  $\Rightarrow$  aluminum = Al<sup>+3</sup> sulfate = SO<sub>4</sub><sup>-2</sup>

Give the name for each compound given its chemical formula:

Name of Compound	individual ions	Formula
lithium cyanide	$\text{Li}^+ \text{CN}^-$	$\text{LiCN}$
iron (III) sulfate		
calcium iodide		
tin (IV) dichromate		
cadmium nitrite		
copper (II) acetate		
zinc carbonate		
lead (II) phosphide		
potassium sulfite		
cobalt (II) nitride		
nickel (II) permanganate		

### NAMING MOLECULAR COMPOUNDS

Indicate number of atoms of each element with Greek prefix before element name:

# of atoms	Greek Prefix	# of atoms	Greek Prefix
1	mono (usually omitted)	6	hexa
2	di	7	hepta
3	tri	8	octa
4	tetra	9	nona
5	penta	10	deca

For the first element: Greek prefix + element name  
 For the second element: Greek prefix + element name stem + "-ide"

Note: Mono is generally omitted, except in common names like  
 CO = carbon monoxide

Name the following molecular compounds:

$\text{SO}_3 =$  \_\_\_\_\_  $\text{SiBr}_4 =$  \_\_\_\_\_

$\text{XeF}_6 =$  \_\_\_\_\_  $\text{ClF}_3 =$  \_\_\_\_\_

$\text{N}_2\text{O}_4 =$  \_\_\_\_\_  $\text{Cl}_2\text{O}_7 =$  \_\_\_\_\_

$\text{PCl}_5 =$  \_\_\_\_\_  $\text{P}_4\text{O}_{10} =$  \_\_\_\_\_

### DETERMINING FORMULAS OF MOLECULAR COMPOUNDS

Use Greek prefix(es) to determine number of atoms of each element in formula.

Get elements and number of atoms of each from name:

Give the formulas for each of the following molecular compounds:

nitrogen trichloride    dibromine heptaoxide    dinitrogen pentasulfide

Name each of the following acids:

HBr (aq) = \_\_\_\_\_ H<sub>2</sub>CrO<sub>4</sub> (aq) = \_\_\_\_\_

H<sub>2</sub>SO<sub>4</sub> (aq) = \_\_\_\_\_ HC<sub>2</sub>H<sub>3</sub>O<sub>2</sub> (aq) = \_\_\_\_\_

Give the formula for each of the following acids: [Don't forget to indicate (aq)!]

hydrofluoric acid = \_\_\_\_\_ nitrous acid = \_\_\_\_\_

phosphoric acid = \_\_\_\_\_ chromic acid = \_\_\_\_\_

hydroiodic acid = \_\_\_\_\_ carbonic acid = \_\_\_\_\_

sulfurous acid = \_\_\_\_\_ nitric acid = \_\_\_\_\_

**PUTTING IT ALL TOGETHER:**

Name each of the following compounds:

BaCl<sub>2</sub> \_\_\_\_\_ NiBr<sub>2</sub> \_\_\_\_\_

HNO<sub>3</sub>(aq) \_\_\_\_\_ SO<sub>2</sub> \_\_\_\_\_

AgF \_\_\_\_\_ PbSe<sub>2</sub> \_\_\_\_\_

NiSO<sub>3</sub> \_\_\_\_\_ PF<sub>5</sub> \_\_\_\_\_

K<sub>2</sub>SO<sub>4</sub> \_\_\_\_\_ Cr(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>3</sub> \_\_\_\_\_

FeP \_\_\_\_\_ Al<sub>2</sub>(CO<sub>3</sub>)<sub>3</sub> \_\_\_\_\_

CuMnO<sub>4</sub> \_\_\_\_\_ Cd(OH)<sub>2</sub> \_\_\_\_\_

**DETERMINING FORMULAS AND NAMES OF ACIDS FROM IONS**

Given an ion, we can get formula of acid by: adding H atoms equal to negative charge on ion depending on suffix of ion name we can name for acid:

F<sup>-</sup> = fluoride ion  $\xrightarrow{\text{add \# of H's equal to negative charge}}$  HF (aq) = **hydrofluoric acid**

NO<sub>2</sub><sup>-</sup> = nitrite ion  $\xrightarrow{\text{add \# of H's equal to negative charge}}$  HNO<sub>2</sub> (aq) = **nitrous acid**

SO<sub>4</sub><sup>-2</sup> = sulfate ion  $\xrightarrow{\text{add \# of H's equal to negative charge}}$  H<sub>2</sub>SO<sub>4</sub> (aq) = **sulfuric acid**

Name each of the following ions, and determine the formula and name of the corresponding acid that forms from the ion.

Name of Ion	Formula of Acid	Name of Acid
Cl <sup>-</sup> = chloride ion	$\Rightarrow$ HCl (aq) =	hydrochloric acid

CO<sub>3</sub><sup>-2</sup> = \_\_\_\_\_  $\Rightarrow$  \_\_\_\_\_ (aq) = \_\_\_\_\_

SO<sub>3</sub><sup>-2</sup> = \_\_\_\_\_  $\Rightarrow$  \_\_\_\_\_ (aq) = \_\_\_\_\_

PO<sub>4</sub><sup>-3</sup> = \_\_\_\_\_  $\Rightarrow$  \_\_\_\_\_ (aq) = \_\_\_\_\_

NO<sub>3</sub><sup>-</sup> = \_\_\_\_\_  $\Rightarrow$  \_\_\_\_\_ (aq) = \_\_\_\_\_

## Worksheet: Writing and Balancing Chemical Reactions

1. Balance the following equations and indicate the type of reaction as formation, decomposition, single replacement, double replacement, hydrocarbon combustion, or other.

- a.  $\underline{\quad} \text{Cu}_{(s)} + \underline{\quad} \text{O}_{2(g)} \rightarrow \underline{\quad} \text{CuO}_{(s)}$
- b.  $\underline{\quad} \text{H}_2\text{O}_{(l)} \rightarrow \underline{\quad} \text{H}_2(g) + \underline{\quad} \text{O}_2(g)$
- c.  $\underline{\quad} \text{Fe}_{(s)} + \underline{\quad} \text{H}_2\text{O}_{(g)} \rightarrow \underline{\quad} \text{H}_2(g) + \underline{\quad} \text{Fe}_3\text{O}_4(s)$
- d.  $\underline{\quad} \text{AsCl}_3(aq) + \underline{\quad} \text{H}_2\text{S}_{(aq)} \rightarrow \underline{\quad} \text{As}_2\text{S}_3(s) + \underline{\quad} \text{HCl}_{(aq)}$
- e.  $\underline{\quad} \text{CuSO}_4 \cdot 5 \text{H}_2\text{O}_{(s)} \rightarrow \underline{\quad} \text{CuSO}_4(s) + \underline{\quad} \text{H}_2\text{O}_{(g)}$
- f.  $\underline{\quad} \text{Fe}_2\text{O}_3(s) + \underline{\quad} \text{H}_2(g) \rightarrow \underline{\quad} \text{Fe}_{(s)} + \underline{\quad} \text{H}_2\text{O}_{(l)}$
- g.  $\underline{\quad} \text{CaCO}_3(s) \rightarrow \underline{\quad} \text{CaO}_{(s)} + \underline{\quad} \text{CO}_2(g)$
- h.  $\underline{\quad} \text{Fe}_{(s)} + \underline{\quad} \text{S}_8(s) \rightarrow \underline{\quad} \text{FeS}_{(s)}$
- i.  $\underline{\quad} \text{H}_2\text{S}_{(aq)} + \underline{\quad} \text{KOH}_{(aq)} \rightarrow \underline{\quad} \text{H}_2\text{O}_{(l)} + \underline{\quad} \text{K}_2\text{S}_{(aq)}$
- j.  $\underline{\quad} \text{NaCl}_{(l)} \rightarrow \underline{\quad} \text{Na}_{(l)} + \underline{\quad} \text{Cl}_2(g)$
- k.  $\underline{\quad} \text{Al}_{(s)} + \underline{\quad} \text{H}_2\text{SO}_4(aq) \rightarrow \underline{\quad} \text{H}_2(g) + \underline{\quad} \text{Al}_2(\text{SO}_4)_3(aq)$
- l.  $\underline{\quad} \text{H}_3\text{PO}_4(aq) + \underline{\quad} \text{NH}_4\text{OH}_{(aq)} \rightarrow \underline{\quad} \text{H}_2\text{O}_{(l)} + \underline{\quad} (\text{NH}_4)_3\text{PO}_4(aq)$
- m.  $\underline{\quad} \text{C}_3\text{H}_8(g) + \underline{\quad} \text{O}_2(g) \rightarrow \underline{\quad} \text{CO}_2(g) + \underline{\quad} \text{H}_2\text{O}_{(l)}$
- n.  $\underline{\quad} \text{Al}_{(s)} + \underline{\quad} \text{O}_2(g) \rightarrow \underline{\quad} \text{Al}_2\text{O}_3(s)$
- o.  $\underline{\quad} \text{CH}_4(g) + \underline{\quad} \text{O}_2(g) \rightarrow \underline{\quad} \text{CO}_2(g) + \underline{\quad} \text{H}_2\text{O}_{(l)}$
- p.  $\underline{\quad} \text{K}_2\text{SO}_4(aq) + \underline{\quad} \text{BaCl}_2(aq) \rightarrow \underline{\quad} \text{KCl}_{(aq)} + \underline{\quad} \text{BaSO}_4(s)$
- q.  $\underline{\quad} \text{C}_5\text{H}_{12}(l) + \underline{\quad} \text{O}_2(g) \rightarrow \underline{\quad} \text{CO}_2(g) + \underline{\quad} \text{H}_2\text{O}_{(g)}$
- r.  $\underline{\quad} \text{Ca}(\text{OH})_2(aq) + \underline{\quad} \text{NH}_4\text{Cl}_{(aq)} \rightarrow \underline{\quad} \text{NH}_4\text{OH}_{(aq)} + \underline{\quad} \text{CaCl}_2(aq)$
- s.  $\underline{\quad} \text{V}_2\text{O}_5(s) + \underline{\quad} \text{Ca}_{(s)} \rightarrow \underline{\quad} \text{CaO}_{(s)} + \underline{\quad} \text{V}_{(s)}$
- t.  $\underline{\quad} \text{Na}_{(s)} + \underline{\quad} \text{ZnI}_2(aq) \rightarrow \underline{\quad} \text{NaI}_{(aq)} + \underline{\quad} \text{Zn}_{(s)}$
- u.  $\underline{\quad} \text{C}_7\text{H}_6\text{O}_3(l) + \underline{\quad} \text{O}_2(g) \rightarrow \underline{\quad} \text{CO}_2(g) + \underline{\quad} \text{H}_2\text{O}_{(l)}$
- v.  $\underline{\quad} \text{Ca}_{(s)} + \underline{\quad} \text{N}_2(g) \rightarrow \underline{\quad} \text{Ca}_3\text{N}_2(s)$
- w.  $\underline{\quad} \text{Fe}_2\text{O}_3(s) + \underline{\quad} \text{H}_2(g) \rightarrow \underline{\quad} \text{Fe}_{(s)} + \underline{\quad} \text{H}_2\text{O}_{(l)}$
- x.  $\underline{\quad} \text{C}_{15}\text{H}_{30}(l) + \underline{\quad} \text{O}_2(g) \rightarrow \underline{\quad} \text{CO}_2(g) + \underline{\quad} \text{H}_2\text{O}_{(g)}$
- y.  $\underline{\quad} \text{BN}_{(s)} + \underline{\quad} \text{F}_2(g) \rightarrow \underline{\quad} \text{BF}_3(s) + \underline{\quad} \text{N}_2(g)$
- z.  $\underline{\quad} \text{C}_{12}\text{H}_{26}(l) + \underline{\quad} \text{O}_2(g) \rightarrow \underline{\quad} \text{CO}_2(g) + \underline{\quad} \text{H}_2\text{O}_{(g)}$

2. Predict the product(s) along with the states, indicate the type of reaction, and balance the following chemical reactions.

- a. A solution of lead (II) nitrate is mixed with a solution of sodium iodide.
- b. Solid zinc sulfide reacts with oxygen in the air.
- c. Liquid butane ( $\text{C}_4\text{H}_{10}(l)$ ) is used as a fuel to ignite a lighter.
- d. Barium hydroxide solution is neutralized by adding hydrochloric acid ( $\text{HCl}_{(aq)}$ ).
- e. Copper metal is placed in a solution of silver nitrate.
- f. Sulfur burns in oxygen to make sulfur dioxide gas.
- g. A solution of aluminum sulfate is mixed with a solution of calcium hydroxide.
- h. Zinc metal is placed in sulfuric acid ( $\text{H}_2\text{SO}_4(aq)$ ).
- i. Aluminum powder is placed in a container filled with chlorine gas.
- j. Sucrose undergoes cellular respiration.

### Steps to solve problems:

1. Write a balanced equation for the reaction.
2. Determine the two substances involved in the reaction, the given and the unknown.
3. Calculate the number of moles of the given substance.
4. Set up a mole ratio using coefficients of the balanced equation for the two substances
5. Substitute values in mole ratio for the given and unknown.
6. Solve the equation for unknown number of moles.
7. Convert unknown moles into mass by multiplying by the unknown's molar mass.

\* \* \* \* \*

### Problems: Quantity-to-Quantity Problems

#### Example Problems:

1. What mass of aluminum oxide must be decomposed to produce 80.0 g of oxygen gas?

1. Write a balanced equation for the reaction.

2. Determine the two substances involved in the reaction, the given and the unknown.

given: 80.0 g of  $\text{O}_2$   
unknown: ? g  $\text{Al}_2\text{O}_3$

3. Calculate the number of moles of the given substance.

$$\begin{aligned} \text{Mass of O}_2 &= 2 \text{ mol} \times 16.00 \text{ g/mol} \\ &= 32.00 \text{ g} \end{aligned}$$

Number of moles  $\text{O}_2$ ,

$$\begin{aligned} n &= \frac{m}{M} \\ &= \frac{80.0 \text{ g}}{32.00 \text{ g/mol}} \\ &= 2.50 \text{ mol} \end{aligned}$$

4. Set up a mole ratio using coefficients of balanced equation for the two substances

$$\frac{\text{Al}_2\text{O}_3}{\text{O}_2} = \frac{2}{3} \leftarrow \begin{array}{l} \text{coefficients from} \\ \text{balanced equation} \end{array}$$

5. Substitute values in mole ratio for the given and unknown.

$$\frac{x}{2.50} = \frac{2}{3}$$

6. Solve the equation for unknown number of moles.

$$x = \frac{(2)(2.50)}{3} = 1.67 \text{ mol of Al}_2\text{O}_3$$

7. Convert unknown moles into mass by multiplying by the unknown's molar mass.

$$\begin{array}{l} \text{Molar mass Al}_2\text{O}_3: \\ 2 \text{ mol Al} \times 26.98 \text{ g/mol} = 53.96 \text{ g} \\ 3 \text{ mol O} \times 16.00 \text{ g/mol} = 48.00 \text{ g} \\ 1 \text{ mol} = 101.96 \text{ g} \end{array}$$

$$\begin{aligned}
 \text{Mass Al}_2\text{O}_3, \\
 m &= nM \\
 &= (1.67 \text{ mol})(101.96 \text{ g/mol}) \\
 &= 170 \text{ g}
 \end{aligned}$$

2. An excess of zinc metal is reacted with 250.0 mL of 0.100 mol/L hydrochloric acid. What volume of hydrogen gas at 25°C and 95.0 kPa can be produced?

1. Write a balanced equation for the reaction.

2. Determine the two substances involved in the reaction, the given and the unknown.

given: 250.0 mL of HCl

unknown: ? g H

(3.41 g)

3. Calculate the number of moles of the given substance.

$$\begin{aligned}
 \text{Moles of HCl,} \\
 n &= CV \\
 &= (0.100 \text{ mol/L})(0.2500 \text{ L}) \\
 &= 0.0250 \text{ mol}
 \end{aligned}$$

4. Set up a mole ratio using coefficients of balanced equation for the two substances

$$\frac{\text{H}}{\text{HCl}} = \frac{1}{2} \leftarrow \begin{array}{l} \text{coefficients from} \\ \text{balanced equation} \end{array}$$

5. Substitute values in mole ratio for the given and unknown.

$$\frac{x}{0.0250} = \frac{1}{2}$$

(40.1 g)

6. Solve the equation for unknown number of moles.

$$x = \frac{(1)(0.0250)}{2} = 0.0125 \text{ mol}$$

7. Convert unknown moles into volume.

$$\begin{aligned}
 PV &= nRT \\
 V &= \frac{nRT}{P} \\
 &= \frac{(0.0125 \text{ mol})(8.31 \text{ L}\cdot\text{kPa/mol}\cdot\text{K})(298 \text{ K})}{95.0 \text{ kPa}} \\
 V &= 0.326 \text{ L} = 326 \text{ mL}
 \end{aligned}$$

(1.08 kg)

## Practice Problems

1. Zinc metal reacts with hydrochloric acid to produce zinc chloride and hydrogen gas. What mass of zinc chloride can be produced by reacting 50.0 mL of 1.00 mol/L HCl<sub>(aq)</sub> with sufficient zinc?

2. Natural gas is mainly methane, CH<sub>4(g)</sub>. What mass of methane must be burned to produce 56.0 L of CO<sub>2(g)</sub> at STP?

3. Aluminum metal is refined from the ore of aluminum called bauxite. In the refining process aluminum oxide decomposes to aluminum and oxygen gas. What mass of aluminum can be produced from 2.04 kg of aluminum oxide?

4. Sodium hydrogen carbonate (bicarbonate of soda) can be used to neutralize acid. Sodium hydrogen carbonate reacts with hydrochloric acid to produce sodium chloride, carbon dioxide gas and water. What volume of carbon dioxide gas at STP can be produced by 16.8 g of sodium hydrogen carbonate?

(4.48 L)

7. Nitric acid reacts with sodium hydroxide to produce sodium nitrate and water. If 25.0 mL of the acid solution reacts with 0.600 g of the  $\text{NaOH}_{(s)}$ , what is the concentration of the nitric acid?

(0.600 mol/L)

5. Photography film is coated with silver chloride. This is produced along with sodium nitrate when silver nitrate reacts with sodium chloride. What mass of silver chloride can be made from 11.7 g of sodium chloride?

(28.7 g)

8. Sodium metal reacts vigorously with water to produce sodium hydroxide and hydrogen gas. What volume of hydrogen at 25.0°C and 113 kPa can be produced from 8.05 g of sodium?

(3.84 L)

6. Ammonia,  $\text{NH}_3(g)$ , reacts with hydrochloric acid to produce ammonium chloride. What mass of ammonia is needed to produce 36.1 g of ammonium chloride?

(11.5 g)

9. In the thermite reaction aluminum reacts with iron (III) oxide to produce iron and aluminum oxide. What mass of aluminum oxide is produced along with 19.55 g of iron?

(17.85 g)

10. Sulfuric acid reacts with potassium hydroxide to produce potassium sulfate and water. What mass of potassium sulfate can be produced from 294.6 g of potassium hydroxide?

(457.5 g)

11. Sodium iodide reacts with lead (II) nitrate to produce sodium nitrate and lead (II) iodide. What mass of lead (II) nitrate will be required to produce 150 g of sodium nitrate?

(292 g)

\* \* \* \* \*

### Review Problems: Stoichiometry

1. What volume of water vapor at STP is produced when 9.6 mol of oxygen gas reacts with sufficient hydrogen gas?

(4.3 x 10<sup>2</sup> L)

3. Ammonia gas decomposes into nitrogen gas and hydrogen gas. How many moles of ammonia are needed to produce 5.00 mol of hydrogen?

(3.33 mol)

2. Nitrogen monoxide gas reacts with oxygen gas to produce nitrogen dioxide gas. How many moles of nitrogen dioxide are formed if 0.530 mol of oxygen are used?

(1.06 mol)

4. Nitrogen dioxide gas reacts with water to produce nitric acid and nitrogen monoxide gas. How many moles of nitrogen monoxide are formed from 0.60 mol of nitrogen dioxide gas?

(0.20 mol)

5. Chlorine gas is one of the most important industrial chemicals. It is produced by the electrolysis of sodium chloride. The other product of the reaction is metallic sodium. How many moles of sodium chloride are needed to produce  $4.00 \times 10^3$  L of chlorine gas at  $25.0^\circ\text{C}$  and 125 kPa?

(404 mol)

8. Copper wire reacts with silver nitrate solution to produce silver metal and a solution of copper (II) nitrate. How many moles of metallic silver would be produced by reacting 2.37 g of copper?

(0.0746 mol)

6. Graphite,  $\text{C}_{(s)}$ , is one form of carbon. It can be burned in air to produce carbon monoxide. If 0.53 mol of graphite is burned, what is the mass of carbon monoxide produced?

(15 g)

9. When iron filings react with copper (II) sulfate solution metallic copper and a solution of iron (II) sulfate are produced. How many moles of copper would be produced if 2.54 g of iron react?

(0.0455 mol)

7. Large amounts of the important metal titanium,  $\text{Ti}_{(s)}$ , are made by reacting titanium (IV) chloride with magnesium metal. Titanium metal and magnesium chloride are produced. What mass of magnesium is required to produce 10.5 mol of titanium?

(511 g)

10. Silver metal reacts with nitric acid to produce nitrogen dioxide, silver nitrate solution and water. How many moles of  $\text{HNO}_3(aq)$  would be required to produce 5.00 g of  $\text{AgNO}_3(aq)$ ?

(0.0589 mol)
